

國立臺灣師範大學 103 學年度碩士班招生考試試題

科目：統計學

適用系所：全球經營與策略研究所

注意：1.本試題共 2 頁，請依序在答案卷上作答，並標明題號，不必抄題。2.答案必須寫在指定作答區內，否則不予計分。

1. (a) Explain "Type II Error." (10 points)
(b) Determine the probability of Type II Error, β for the following test of hypothesis, given that $\mu = 45$. (15 points)
 $H_0: \mu = 50$
 $H_1: \mu < 50$
 $\alpha = .05, \sigma = 10, n = 25$
2. The diameter of Ping-Pong balls manufactured at a large factory is expected to be normally distributed with a mean of 1.30 inches and a standard deviation of 0.04 inch. If random samples of 400 balls are selected, what proportion of the sample means would be
(a) between 1.303 and 1.305 inches? (5 points)
(b) less than 1.302 inches? (5 points)
(c) If a sample size of only 100 balls were selected, what would your answers have been in (a) and (b)? (5 points)
(d) What is more likely to occur— a sample mean between 1.303 and 1.305 in a sample of 100 balls or a sample mean between 1.302 and 1.303 in a sample of 400 balls? Explain. (10 points)

A marketing researcher randomly selected 25 customers who entered one 7-11 located in the central area of Taipei city and the countryside area, respectively. The mean ages is 25 years old for city sample and 35 years old for countryside sample, along with the same variance of 25. (Hint: the two-tailed critical value of t-distribution with the df=48 and $\alpha=.05$ is around 2)

3. What is the name of analysis and the conclusions of the testing if the customers' age of two areas differ significantly? ($\alpha=.05$) (15 points)
4. The results of analysis of location and gender differences on the age of customer were listed in the following table. At first, please indicate the values of A to E. Then, explain the name of the analysis and the meaning of each columns and the conclusions of testing. ($\alpha=.05$) (20 points)

Sources	SS	df	MS	F	P
A:Location	A	1	15	3.75	0.032
B:Gender	10	B	10	2.50	0.072
A×B	16	1	D	E	0.028
Error	184	C	4		
Total	225	49			

5. The results of using the age information to predict the amount of expense shown that $Y=46X+105, R^2=.50(F(1,48)=78.23 (p<.001)$. What is the name of the analysis? Please also explain the meaning of each values and the conclusions of testing. ($\alpha=.05$) (15 points)
