

逢甲大學101學年度碩士班招生考試試題 編號：008 科目代碼：

科目	統計學	適用系所	工業工程與系統管理學系A組、B組	時間	100 分鐘
----	-----	------	------------------	----	--------

※請務必在答案卷作答區內作答。 共 3 頁第 1 頁

- In a simple 6-from-49 lottery, a player chooses six numbers from 1 to 49 (no duplicates are allowed). If all six numbers on the player's ticket match those produced in the official drawing (regardless of the order in which the numbers are drawn), then the player is a jackpot winner. Suppose 1, 2, 11, 26, 27, and 31 are the winning numbers of one draw. What is the probability for the same set of numbers to win jackpot in the next draw? (5%)
- A Ph.D. student studying for a qualifying exam recognizes five potential essay questions that might be the one asked on the exam. Unfortunately, this person has time to study for only one of the essay questions. The student picks, at random, one of the questions to study. If the student studies the right question, the probability of passing the exam is 0.85. If one of the other four questions is on the exam, the probability of passing is 0.20. The exam does, in fact, contain one of the five questions.
 - What is the probability the candidate will pass the test? (5%)
 - Suppose the candidate passes, what is the probability that this person picked the correct question to study? (10%)
- Suppose there is an assembly line which runs 24 hour a day. The daily number of the assembly line shutdowns follows a Poisson distribution with mean 3.0.:
 - What is the probability that there are more than three shutdowns in a day? (5%)
 - Suppose three shifts are scheduled for the assembly line, each shift covers 8-hours of working. What is the probability that there is more than 1 shutdown in one shift? (10%)
 - Assume that the company loses \$50,000 with each shut down. Calculate the expected daily loss. (5%)
 - If a shutdown happens at 9:00AM in one day, what is the probability that the next shutdown would happen before noon in the same day? (10%)
- Two catalysts may be used in a batch chemical process. Twelve batches were prepared using catalyst 1, resulting in an average yield of 86 and a sample standard deviation of 3. Fifteen batches were prepared using catalyst 2, and they resulted in an average yield of 89 with a standard deviation of 2. Assume that yield measurements are approximately normally distributed with the same standard deviation.
 - Is there evidence to support a claim that catalyst 2 produces a higher mean yield than catalyst 1? Use $\alpha = 0.01$. (10%)
 - Find a 99% confidence interval on the difference in mean yields that can be used to test the claim in part (1). (10%)
- A random sample of 500 citizens in Taichung City is asked if they favor the use of oxygenated fuels year-round to reduce air pollution. If more than 400 citizens respond positively, we will conclude that more than 60% of the citizens favor the use of these fuels.
 - Find the probability of type I error if exactly 60% of the citizens favor the use of these fuels. (10%)
 - What is the type II error probability β if 75% of the citizens favor this action? (10%)
- Suppose we have a random sample of size $2n$ from a population denoted by X , and $E(X) = \mu$, and $V(X) = \sigma^2$. Let $\bar{X}_1 = \frac{1}{2n} \sum_{i=1}^{2n} X_i$ and $\bar{X}_2 = \frac{1}{n} \sum_{i=1}^n X_i$ be two estimators of μ . Which is the better estimator of μ ? Explain your choice. (10%)

Percentage Points $t_{\alpha, v}$ of the t Distribution
