1. (7%)

The following hypothesis test is to be conducted.

$$H_0: \text{Median} \leq 150$$

$$H_1: \text{Median} > 150$$

A sample of 30 provided 22 observations greater than 150, 3 observations equal to 150, and 5 observations less than 150. Use $\alpha = 0.01$. What is your conclusion? There is no score without the calculation process.

2.

Market betas for individual stocks are determined by simple linear regression. For each stock, the dependent variable is its quarterly percentage return (capital appreciation plus dividends) minus the percentage return that could be obtained from a risk-free investment (the Treasury Bill rate is used as the risk-free rate). The independent variable is the quarterly percentage return (capital appreciation plus dividends) for the stock market (S&P 500) minus the percentage return from a risk-free investment. An estimated regression equation is developed with quarterly data; the market beta for the stock is the slope of the estimated regression equation (b_1). The value of the market beta is often interpreted as a measure of the risk associated with the stock. Market betas greater than 1 indicate that the stock is more volatile than the market average; market betas less than 1 indicate that the stock is less volatile than the market average. Suppose that the following figures are the differences between the percentage return and the risk-free return for 10 quarters for the S&P 500 and Horizon Technology.

| S&P 500 (%) | Horizon Technology (%) |
|-------------|------------------------|
| 1.2 | -0.7 |
| -2.5 | -2.0 |
| -3.0 | -5.5 |
| 2.0 | 4.7 |
| 5.0 | 1.8 |
| 1.2 | 4.1 |
| 3.0 | 2.6 |
| -1.0 | 2.0 |
| 0.5 | -1.3 |
| 2.5 | 5.5 |

本科原始成績：100 分

是否使用計算機：是

- (1) (8%) Develop an estimated regression equation. What is Horizon Technology's market beta?
- (2) (7%) Test for a significant relationship at the 0.05 level of significance.
- (3) (7%) Did the estimated regression equation provide a good fit? Explain by using coefficient of determination.
3. (7%) The Wall Street Journal's Shareholder Scoreboard tracks the performance of 1000 major U.S. companies. The performance of each company is rated based on the annual total return, including stock price changes and the re-investment of dividends. Ratings are assigned by dividing all 1000 companies into five groups from A (top 20%), B (next 20%), to E (bottom 20%). Shown here are the one-year ratings for a sample of 60 of the largest companies. Do the largest companies differ in performance from the performance of the 1000 companies in the Shareholder Scoreboard? Use $\alpha = 0.05$. There is no score without the calculation process.
- | A | B | C | D | E |
|---|---|----|----|----|
| 5 | 8 | 15 | 20 | 12 |
4. (7%) A local bank reviewed its credit card policy with the intention of recalling some of its credit cards. In the past approximately 5% of cardholders defaulted, leaving the bank unable to collect the outstanding balance. Hence, management established a prior probability of 0.05 that any particular cardholder will default. The bank also found that the probability of missing a monthly payment is 0.20 for customers who do not default. Of course, the probability of missing a monthly payment for those who default is 1. Given that a customer missed one or more monthly payments, compute the posterior probability that the customer will default. There is no score without the calculation process.
5. (7%) Suppose one has a stereo system consisting of two main parts, a radio and a speaker. If the lifetime of the radio is exponential with mean 1000 hours and the lifetime e of the speaker is exponential with mean 500 hours independent of the radio's lifetime, then what is the probability that the system's failure (when it occurs) will be caused by the radio failing?
6. (5%) Let $E\{X\}$ and $\text{Var}(X)$ denote the expectation and variance of a random variable X , respectively. Please show that:

是否使用計算機：是

$$\text{Var}(X) = E\{X^2\} - (E\{X\})^2.$$

7. Let X be normally distributed with the mean 0 and the variance 1, as well as $Y = \mu + \sigma X$ and $Z = e^Y$, where μ and $\sigma > 0$ are constant. Please answer the following questions:

- (1) (5%) What is the distribution of Y ?
- (2) (10%) Following (1), please prove it.
- (3) (10%) Please evaluate the expectation of Z .

8. Let $W(t)$, where $t \geq 0$, be a stochastic process which satisfies the following conditions:

i. $W(0) = 0$.

ii. Given $0 \leq s < t$, $W(t) - W(s)$ is normally distributed with the mean 0 and the variance $t - s$.

iii. Given $0 \leq t_1 < t_2 < t_3$, $W(t_2) - W(t_1)$ and $W(t_3) - W(t_2)$ are independent.

Please answer the following questions:

- (1) (10%) Given $0 \leq s < t$, please show that the covariance of $W(s)$ and $W(t)$ is s . (Hint:

$$W(t) = (W(t) - W(s)) + W(s)$$

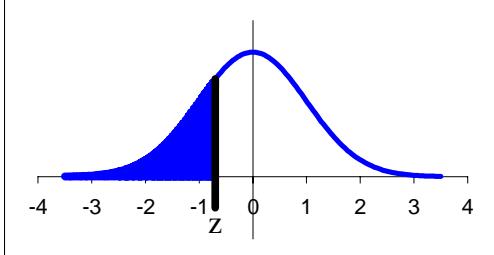

- (2) (10%) Let $E\{X|Y\}$ denote the expectation of a random variable X given another random variable Y . Given $0 \leq s < t$, please evaluate $E\{E\{W(t)|W(s)\}|W(0)\}$.

Table 1a: Standard Normal Probabilities

The values in the table below are cumulative probabilities for the standard normal distribution Z (that is, the normal distribution with mean 0 and standard deviation 1). These probabilities are values of the following integral:

$$P(Z \leq z) = \int_{-\infty}^z \frac{1}{\sqrt{2\pi}} e^{-x^2/2} dx$$

Geometrically, the values represent the area to the left of z under the density curve of the standard normal distribution:

| z | .00 | .01 | .02 | .03 | .04 | .05 | .06 | .07 | .08 | .09 |

Table 2: *t*-Distribution Critical Values

The entries in the table below are the critical values $t_{n,p}$, where n represents the number of degrees of freedom and p is the upper tail probability. That is, if T has the *t*-distribution with n degrees of freedom, then the value in the table represents the number $t_{n,p}$ such that $P(T > t_{n,p}) = p$.

| d.f. | Upper Tail Probability p | | | | | | | | | |
|----------|--------------------------|-------|-------|-------|--------|--------|--------|---------|---------|---------|
| | 0.20 | 0.15 | 0.10 | 0.05 | 0.025 | 0.01 | 0.005 | 0.0025 | 0.001 | 0.0005 |

Table 3: Chi-Square Distribution Critical Values

The entries in the table below are the critical values $\chi_{n,p}^2$, where n represents the number of degrees of freedom and p is the upper tail probability. That is, if X has the chi-square distribution with n degrees of freedom, then the value in the table represents the number $\chi_{n,p}^2$ such that $P(X > \chi_{n,p}^2) = p$.

| d.f. | Upper Tail Probability p | | | | | | | | | |
|------|--------------------------|--------|--------|--------|--------|---------|---------|---------|---------|---------|
