

國立臺灣師範大學 100 學年度碩士班招生考試試題

科目：熱力學

適用系所：工業教育學系

注意：1.本試題共 5 頁，請依序在答案卷上作答，並標明題號，不必抄題。2.答案必須寫在指定作答區內，否則不予計分。

- What is the net force acting on a bus at a constant velocity of 40 km/h (a) on a level road and (b) on an uphill road? (6 points)
- What is quality? Does it have any meaning in the compressed liquid region? (6 points)
- When a system is adiabatic, what can be said about the entropy change of the substance in the system? (4 points)
- Consider the function $u(v, w)$, its derivatives $(\frac{\partial u}{\partial v})_w$ and $(\frac{\partial u}{\partial w})_v$, and the total derivative $\frac{du}{dw}$. (a) how do the magnitudes $(\partial v)_w$ and the dv compare? (b) how do the magnitudes $(\partial u)_w$ and the du compare? (c) Is there any relation among du , $(\partial u)_v$, and $(\partial u)_w$? (9 points)
- Consider the U-tube whose arms are open to the atmosphere. Now water is poured into the U-tube from one arm, and light oil ($\rho = 900 \text{ kg/m}^3$) from the other. One arm contains 80-cm-high water, while the other arm contains both fluids with an oil-to-water height ratio of 5. Determine the height of h_{oil} and h_{w2} . (10 points)

- A 100 m^3 tank contains compressed air at 1 MPa and 300 K. Determine how much work can be obtained from this air if the environment conditions are 100 kPa and 300 K. (15 points)

國立臺灣師範大學 100 學年度碩士班招生考試試題

7. Consider a two-stage compression R-134a refrigeration system operating between the pressure limits of 1.4 and 0.1 MPa. The refrigerant leaves the condenser as a saturated liquid and is throttled to a flash chamber operating at 0.4 MPa. Part of the refrigerant evaporates during this flashing process, and this vapor is mixed with the refrigerant leaving the low-pressure compressor. The mixture is then compressed to the condenser pressure by the high-pressure compressor. The liquid in the flash chamber is throttled to the evaporator pressure and cools the refrigerated space as it vaporizes in the evaporator. Assuming the refrigerant leaves the evaporator as a saturated vapor and both compressors are isentropic. (30 point)

Part 1: (a) $T-s$ schematic diagram, (b) determine the fraction of the refrigerant which evaporates as it is throttled to the flash chamber, (c) determine the amount of heat removed from the refrigerated space, (d) compute the compressor work per unit mass of refrigerant flowing through the condenser, and (e) the coefficient of performance.

Part 2: If the two-stage compression refrigeration system is modified to the single-stage compression refrigeration system, re-determine steps (a)~(e).

8. A given space contains the dry and wet-bulb temperatures at 25°C and 20°C by air conditioning system. The total heat gain to the space has been determined to be 24 kW, of which 18 kW is sensible heat transfer. The outdoor air requirement of the occupants is 20% (by mass) of supply air. The outdoor air has a temperature and relative humidity of 32°C and 70 %, respectively. Determine the quantity and the state of the air supplied to the space and the required capacity of the cooling and dehumidifying equipment. (The relative humidity of supply air is assumed to 90% RH). (20 point)

國立臺灣師範大學 100 學年度碩士班招生考試試題
