

考試科目	統計學 4211A	系所別	企業管理研究所 MBA學位課程甲組	考試時間	2月18日(六) 第三節
------	--------------	-----	----------------------	------	--------------

1. (20%) An insurance salesman visits up to three clients each day, hoping to sell a new policy. He stops for the day once he makes a sales. Each client independently decides whether to buy a policy; 10% of clients purchase the policy.
- (1) Create a probability model for the number of clients the salesman visits each day. (6%)
 - (2) Find the expected number of clients. (4%)
 - (3) If the salesman spends about 2.5 hours with each client, then how many hours should he expect to be busy each day? (3%)
 - (4) If the salesman earns TWD10,000 per policy sold, how much can he expect to make per day? (7%)
2. (30%) Hoping to lure more shoppers downtown, a city builds a new public parking garage in the central business district. The city plans to pay for the structure through parking fees. During a two-month period (44 weekdays), daily fees collected averaged TWD25,000 with a standard deviation of TWD7,000.
- (1) Write a 90% confidence interval for the mean daily income this parking garage will generate. (8%)
 - (2) The consultant who advised the city on this project predicted that parking revenue would average TWD26,500 per day. Do you think the consultant was correct on the basis of part (1)? Why or why not? (4%)
 - (3) Give a 90% confidence interval for the total revenue earned during five weekdays. (3%)
 - (4) Someone suggests that the city should use the data to create a 95% confidence interval instead of the 90% interval first created. Would this interval be better for the city planners? Why? (4%)
 - (5) How would city planners achieve an interval estimate that would better serve their planning need? (3%)
 - (6) How many days' worth of data must planners collect to have 95% confidence of estimating the true mean to within TWD700? (8%)
3. (20%) A survey reports that when going shopping, 181 of 756 men and 275 of 809 women go for bargains. Answer the following questions at the 0.05 level of significance.
- (1) Is the proportion of men who shop for bargains less than the proportion of women who shop for bargains? (10%)
 - (2) Apply the χ^2 test to examine whether there exists any relationship between gender and shopping for bargains. (10%)
4. (30%) A company operates in the US, Europe, South American and the Pacific Rim. Management is comparing the costs incurred in its health benefits program by employees across these four regions. It fits a multiple regression of the amount spent for sample of 25 workers on three dummy variables that represents

------	--------------	-----	-----------------------	------	--------------

US, Europe, and the Pacific Rim. The following tables summarizes the estimation results.

Table A. Analysis of variance

Source of Variation	Sum of square	Degrees of freedom	Mean squares	F
Regression	(a)	(c)	19357383	(g)
Error	(b)	(d)	(f)	
Total	72241280	(e)		

Table B. Parameter estimates

Term	Estimate	Standard error	t statistic
Intercept	1795.05	76.84	23.36
US	1238.10	108.66	11.39
Europe	717.84	108.66	6.61
Pacific Rim	-785.58	108.66	-7.23

- (1) Fill in all the empty cells (a)-(g) in Table A. (7%)
- (2) Please interpret the meanings of the estimated regression coefficients in Table B. (8%)
- (3) Compute the values of R^2 and standard error for the regression model. (5%)
- (4) This analysis was done in US dollars. Please write down both Tables A and B when the same analysis is done in euros (1 euro = 1.08 USD). (10%)
