

考 試 科 目	統計學	系 所 別	財務管理學系	考 試 時 間	2 月 18 日(一) 第 3 節
---------	-----	-------	--------	---------	-------------------

1. (15%) It is known that the probability of selecting an adult over 40 years of age with cancer is 0.05. The probability of a doctor correctly diagnosing a person with cancer as having the disease is 0.78 and the probability of incorrectly diagnosing a person without cancer as having the disease is 0.06.
- (1) What is the probability that a person is diagnosed as having cancer? (8%)
- (2) What is the probability that a person diagnosed as having cancer actually has the disease? (7%)

2. (20%) A manager randomly selected 150 large cash transactions at a bank that were made in January. The manager then carefully tracked down the details of these transactions to see that the correct procedures for reporting these large transactions were followed.

(1) In order to use a binomial model in this problem, what assumption are necessary? (6%)

If the chance for a procedural error is 10%, what is the probability that the manager finds more than five such transactions?

(2) Express it using the binomial distribution. (4%)

(3) Approximate it using the normal distribution. (10%)

3. (35%) A large insurance company wants to estimate the difference between the average amount of term life insurance purchased per family and the average amount of whole life insurance purchased per family. The following sample estimates are obtained.

	Term	Whole life
Mean	75,000	45,000
Standard deviation	22,000	15,500
Sample size	25	29

TWD

Assume the amount of insurance is normally distributed.

- (1) How does the relative variability for term and whole life insurance amounts compare? (5%)
- (2) How large a sample should the company take to be within 3,500 of the actual average for the whole life insurance amounts with 99% confidence? (8%)
- (3) Construct a 95% confidence interval to estimate the difference in means for these two groups. (7%)
- (4) Determine whether the variances of term and whole life insurance amounts are the same. Use the 0.05 level of significance. (7%)
- (5) Determine whether the means of term and whole life insurance amounts are the same at the 0.05 level of significance. (8%)

---------	-----	-------	--------	---------	--------------------

4. (30%) A random sample of 2,229 loans made by banks for the purchase of new automobiles was studied to identify variables that explain the interest rate charged. The following table shows the estimation result.

Variable	Estimate	t statistic
Intercept	15.47	3.12
Loan size (in TWD)	-0.0015	10.30
Length of loan (in months)	-0.906	4.20
Percent down payment	-0.522	8.35
Cosigner (0=No, 1=Yes)	-0.009	3.02
Unsecured loan (0=No, 1=Yes)	0.034	2.19
Total payment (borrower's monthly installment debt)	0.100	1.37
Total income (borrower's total monthly income)	-0.170	2.37
Bad credit report (0=No, 1=Yes)	0.012	1.99
Young borrower (0=older than 25, 1=25 or younger)	0.027	2.85
Male borrower (0=female, 1=male)	-0.001	0.89
Married (0=No, 1=Yes)	-0.023	1.91
Own home (0=No, 1=Yes)	-0.011	2.73
Years at current address	-0.124	4.21

$$SSTotal=0.502; R^2=0.297$$

- (1) Examine the signs of each of the statistically significant coefficients and give a short explanation of what they tell us. Use the 0.05 level of significance. (18%)
- (2) Construct the ANOVA table for the regression analysis. (8%)
- (3) Compute the standard error of the regression and explain its meaning. (4%)
