科目代碼：4902

考試科目：統計學

—作答注意事項—

1. 請核對答案卷(卡)上之准考證號、科目名稱是否正確。
2. 考試開始後，請於作答前先翻閱整份試題，是否有污損或試題印刷不清，得舉手請監試人員處理，但不得要求解釋題意。
3. 考生限在答案卷上標記「由此開始作答」區內作答，且不可書寫姓名、准考證號或與作答無關之其他文字或符號。
4. 答案卷用盡不得要求加頁。
5. 答案卷可用任何書寫工具作答，惟為方便閱卷辨識，請儘量使用藍色或黑色書寫；答案卡限用 2B 鉛筆畫記；如畫記不清(含未依範例畫記)致光學閱讀機無法辨識答案者，其後果一律由考生自行負責。
6. 提早交卷者不可攜出試題，請將試題連同答案卷(卡)交予監考人員，攜出將以違規論處。當節考試結束後試題將置於講台，可自行取回，本試場不負保管責任。
7. 其他應考規則、違規處理及扣分方式，請自行詳閱准考證明上「國立清華大學試場規則及違規處理辦法」，無法因本試題封面作答注意事項中未列明而稱未知悉。

The table below reports summary statistics of stock market index returns for various markets over the period from January 1, 1998 to December 31, 2020, where TW denotes Taiwan and HK denotes Hong Kong. From a statistical analysis perspective, which market should we invest in? Why? It is often said that higher risk is associated with higher return. Do real-world data exhibit such a pattern? How can this relationship be empirically examined?

It is often said in finance that: *"Do not put all your eggs in one basket."* In other words, diversification is important. This idea can be explained using statistical concepts. Under what assumptions does this statement hold true? In what situations might this statement be incorrect? Please prove your results.

1. The random variable X has a log-normal distribution if $Y = \ln X$ is normally distributed. If $Y \sim N(0, 1)$, the mean of X is $1/2$.
2. Suppose the simple regression model is given by $y_i = \beta x_i + \varepsilon_i$, $\varepsilon_i \sim N(0, \sigma^2)$. Let $\hat{\varepsilon}_i$ denote the residual of this regression model. In this case, we have
$$\sum_{i=1}^n \hat{\varepsilon}_i = \sum_{i=1}^n x_i \hat{\varepsilon}_i = 0.$$
3. Consider a simple regression model $y_i = \beta x_i + \varepsilon_i$. Model 1 assumes homoskedasticity, that is, $\varepsilon_i \sim N(0, \sigma^2)$. Model 2 assumes heteroskedasticity, that is, $\varepsilon_i \sim N(0, \sigma_i^2)$ where $\sigma_i^2 \neq \sigma_j^2$ may vary across observations. Suppose $\{(y_1, x_1), \dots, (y_n, x_n)\}$ are the data collected by the researcher. In this case, regardless of whether Model 1 or Model 2 is assumed, the ordinary least squares (OLS) estimates are identical.
4. It is well known that $E(X - E(X))^2 \leq E(X - c)^2, \forall c$ for any real number c ; this is an important property of the mean squared error (MSE). Let X and Y be two independent random variables, and let $\phi(Y)$ be a function of Y . Then $E(X - E(X))^2 \leq E(X - \phi(Y))^2$ also holds.

5. Let the Student's t distribution be denoted by $t(n)$, where n is its degrees of freedom. Let $F(m, n)$ denote the F distribution with degrees of freedom m, n . When $n=3$, the first and second central moments of $t(n)$ exist (with mean equal to 0 and variance equal to 3), but the third central moment does not exist. Moreover, applying a nonlinear transformation to $t(3)$ yields a $t(3)^2 = F(1, 3)$ distribution. For this $t(3)^2$ distribution, the first central moment exists, but the second central moment (i.e., the variance) and the third central moment do not exist.

Cumulative Standardized Normal Distribution

$A(z)$ is the integral of the standardized normal distribution from $-\infty$ to z (in other words, the area under the curve to the left of z). It gives the probability of a normal random variable not being more than z standard deviations above its mean. Values of z of particular importance:
